

1-2. Implementation and normalisation

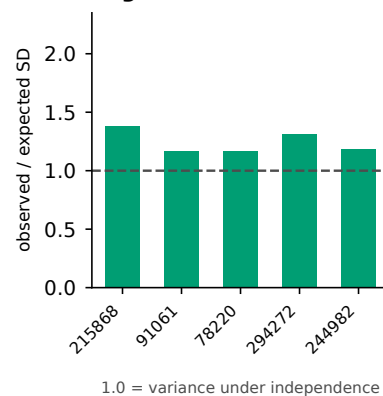

(a)

3. Platform suitability

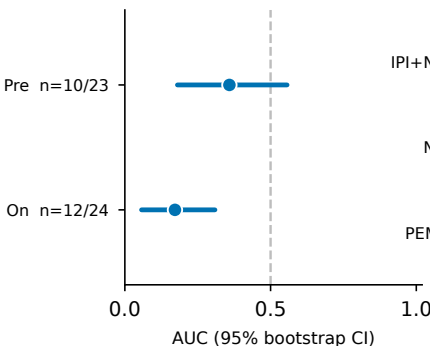

3. Score not degenerate

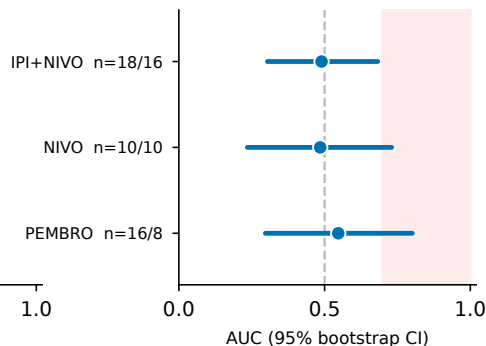

5. Biopsy

(d) timepoint

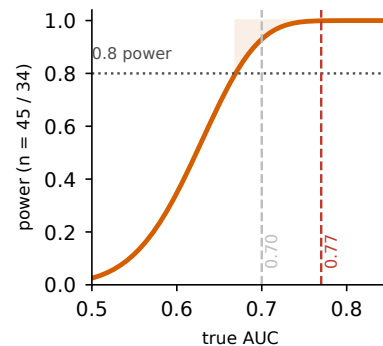

6. Treatment regimen

(e)

4. Sample size

Excluded outright (6 of 9); item 4 addressed but not fully resolved:

- | | | |
|--------------------------|---------------------|--------------------------------------|
| 1 implementation error | 4 sample size | 7 endpoint definition |
| 2 normalisation | 5 biopsy timepoint | population composition X |
| 3 platform unsuitability | 6 treatment regimen | weakness in the derivation cohorts X |

X = the available data cannot exclude this. Item 4 is excluded against the published performance (power 0.93 at AUC 0.70) but not against a weak signal. Item 7 needed no data panel: the native

endpoint of GSE215868 is 24-month long-term benefit (PFS-derived), not RECIST, so response was re-derived from best overall response to match the endpoint on which IMPRES was reported.
